

What if you didn't have to choose between heating performance and product design?

Novara's Carbon Nanotube Films are:

- Lightweight and ultra-thin
- Energy-efficient
- Manufacturable to fit almost any product design
- Long-lasting and durable
- Customizable to voltage and power requirements

WHY CARBON NANOTUBE?

➤ **Lighter and less bulky technology**

Novara's films are less than .010 inches thick and weigh about 1.2 oz/ft², adding very little weight and occupying minimal space in the overall product.

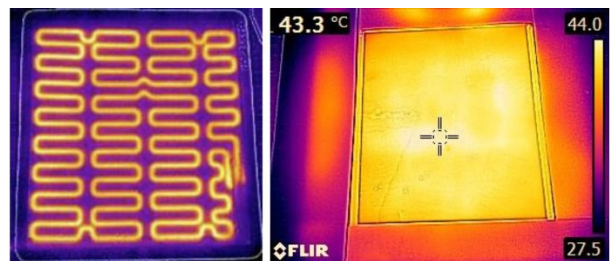

➤ **Flexible material and shape**

The thin, flexible films can be custom-cut or bent to fit nearly any product shape without compromising product design, weight, or heating performance. They can be adapted to a product's physical design requirements while delivering efficient heat.

➤ **Uniform heating**

Novara's carbon nanotube products don't rely on wires to distribute heat. Instead, heat is dispersed evenly across the entire film, resulting in a highly uniform temperature profile with minimal hot or cold spots.

➤ **Fast heat-up time**

The film heats up to the desired temperature quickly and efficiently, reducing wait time and meeting both high- and low- temperature product needs.

➤ **Easy manufacturing and installation**

While Novara's carbon nanotube technology is typically deposited on films, it can be applied to other materials as well. Novara's films can be attached to almost any surface using adhesives or fasteners, making them a heating solution for a wide range of consumer products. In addition, Novara's films are produced using scalable production processes, allowing heater production to grow or flex with changes in demand.
